

## **Aquifer Conditions**

**Well Name: WB-8**

Hydraulic Conditions:	Inconclusive until pressure profile is completed. Aquifer apparently contained within bedrock (andesite).
Pertinent Observations:	Well drilled with air hammer to total depth of 445'. Water level in open borehole at 254' after overnight recovery. Staining and calcite formation noted on fracture faces throughout bedrock interval. Borehole produces approximately 4 gallons per minute via air lifting with the drill string.
